Running a Parallel event in Ski Pro

This document is written based on the old Ski Pro V2.27 but you should find that it works much the same in the latest versions and can be adapted to have more parallel rounds than we've shown.

In this example we are using an existing event to provide the qualifying times to take into the parallel rounds.

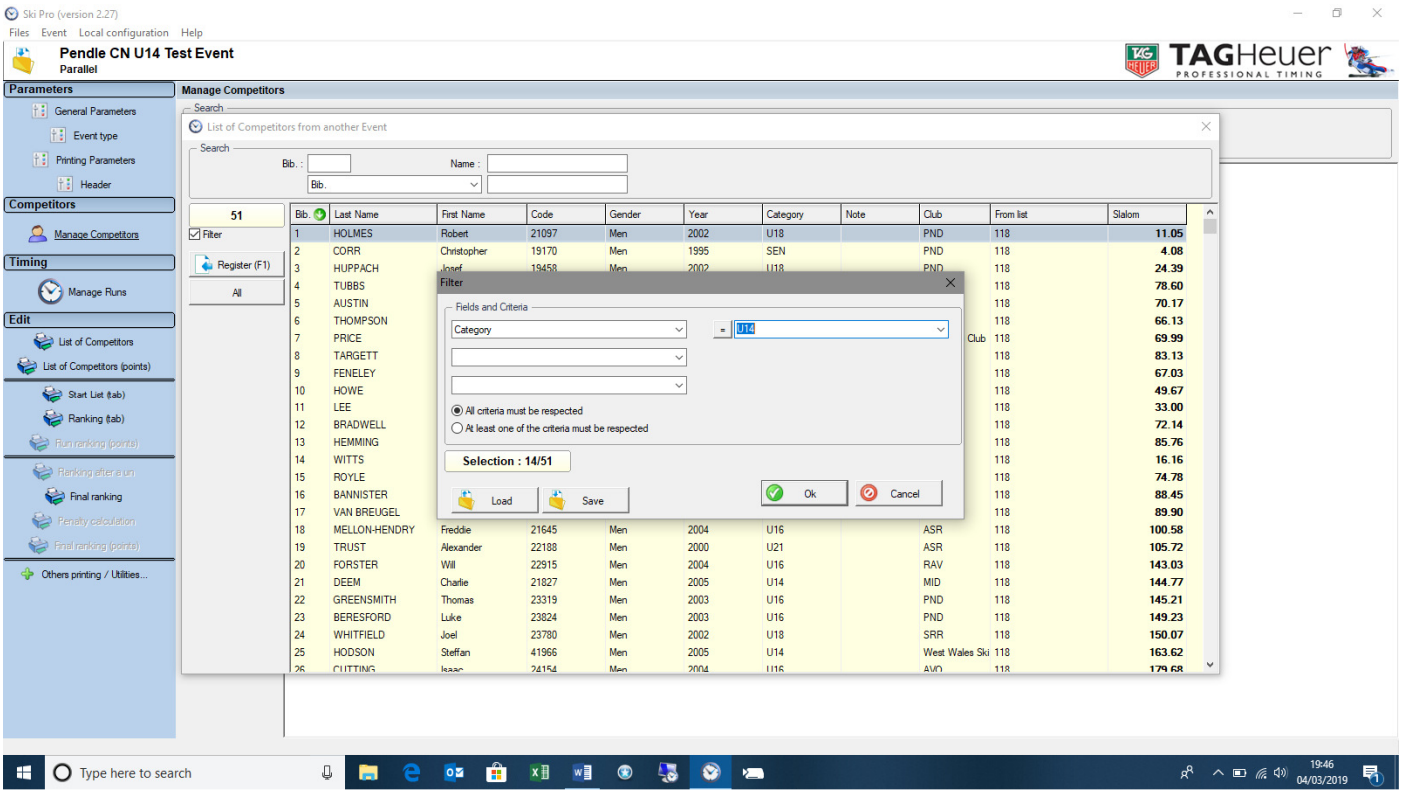

Before running a parallel event it is necessary to update some of the programme files within the ski pro fields to allow parallel start lists to be created automatically in a default ranked order.

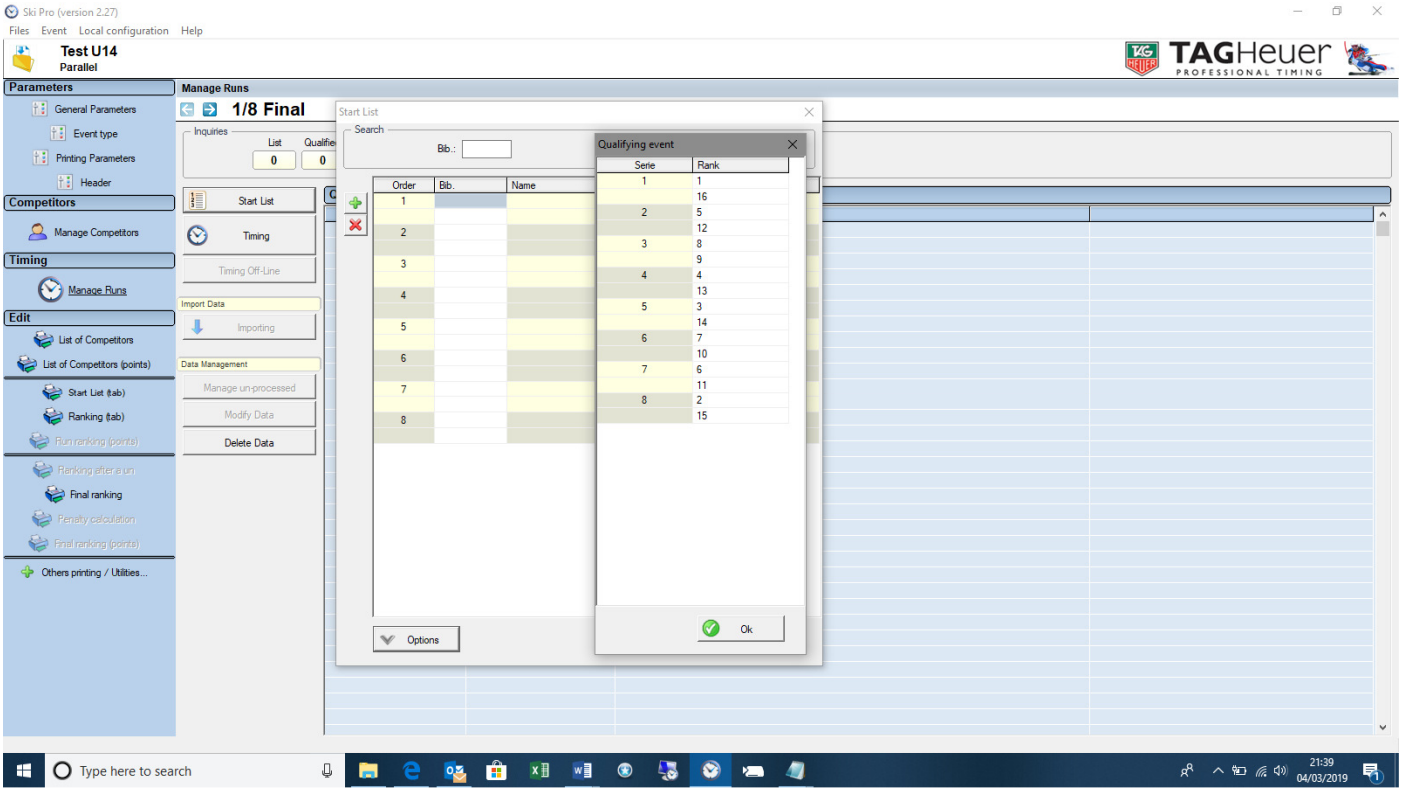

Create event that qualifying competitors will be entered in to - in this example top 16 hit parameters to link the qualifying event amend the competitor field from code to bib if using the same bibs as the qualifying event

The competitors are filtered from the qualifying event:

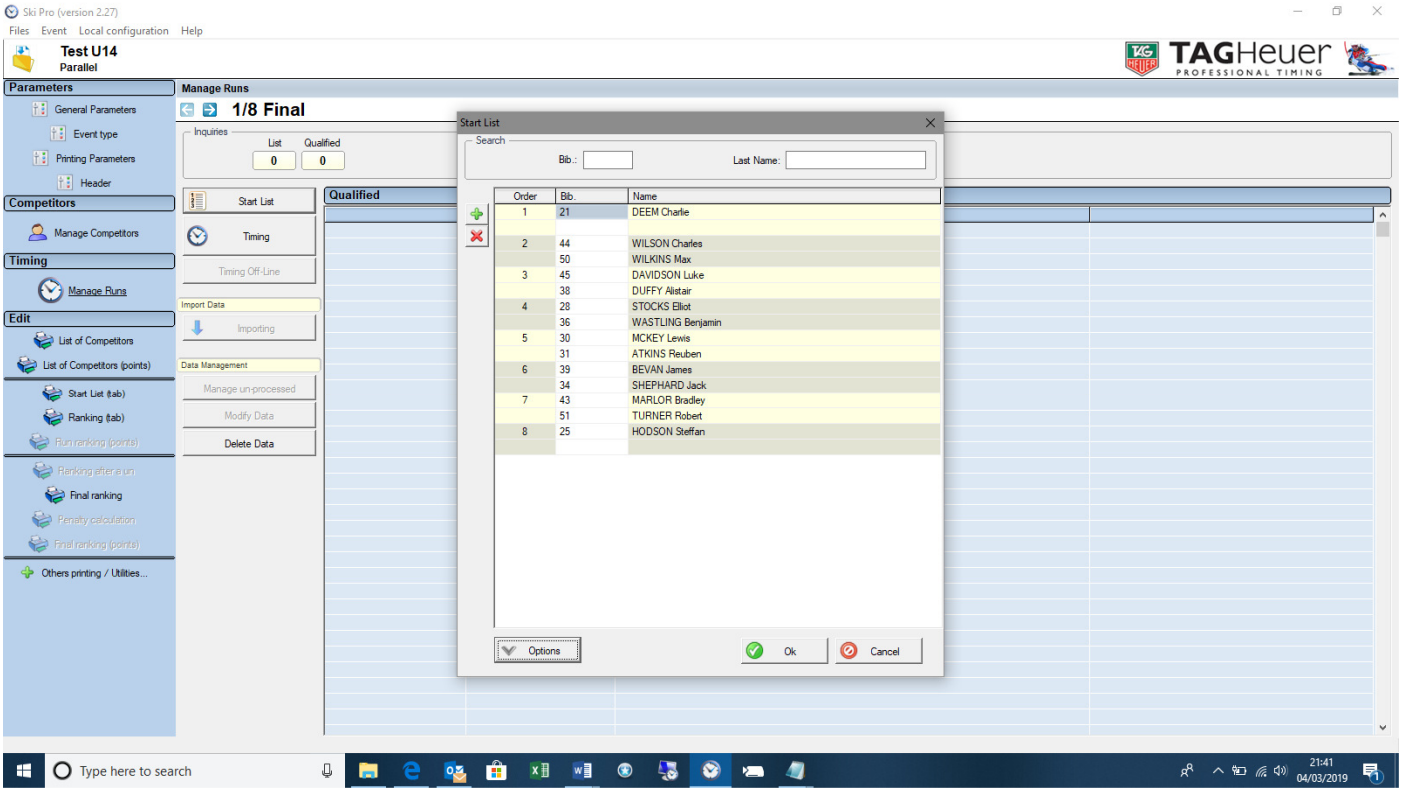

Next we need to create a start list from the Manage Runs screen:

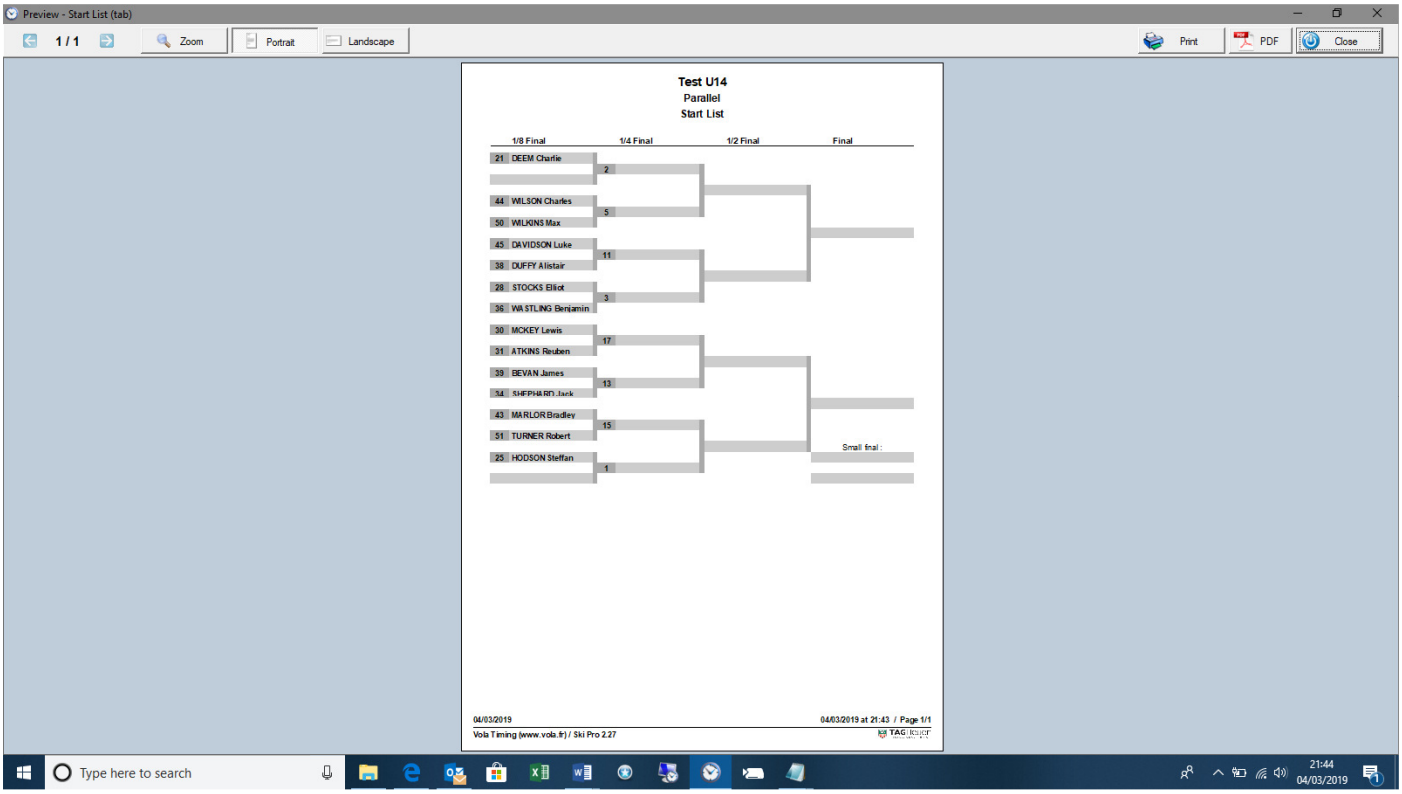

Click on start list – options – prepare with last round.

Provided the event files have been updated the ranking order will appear by default as above.

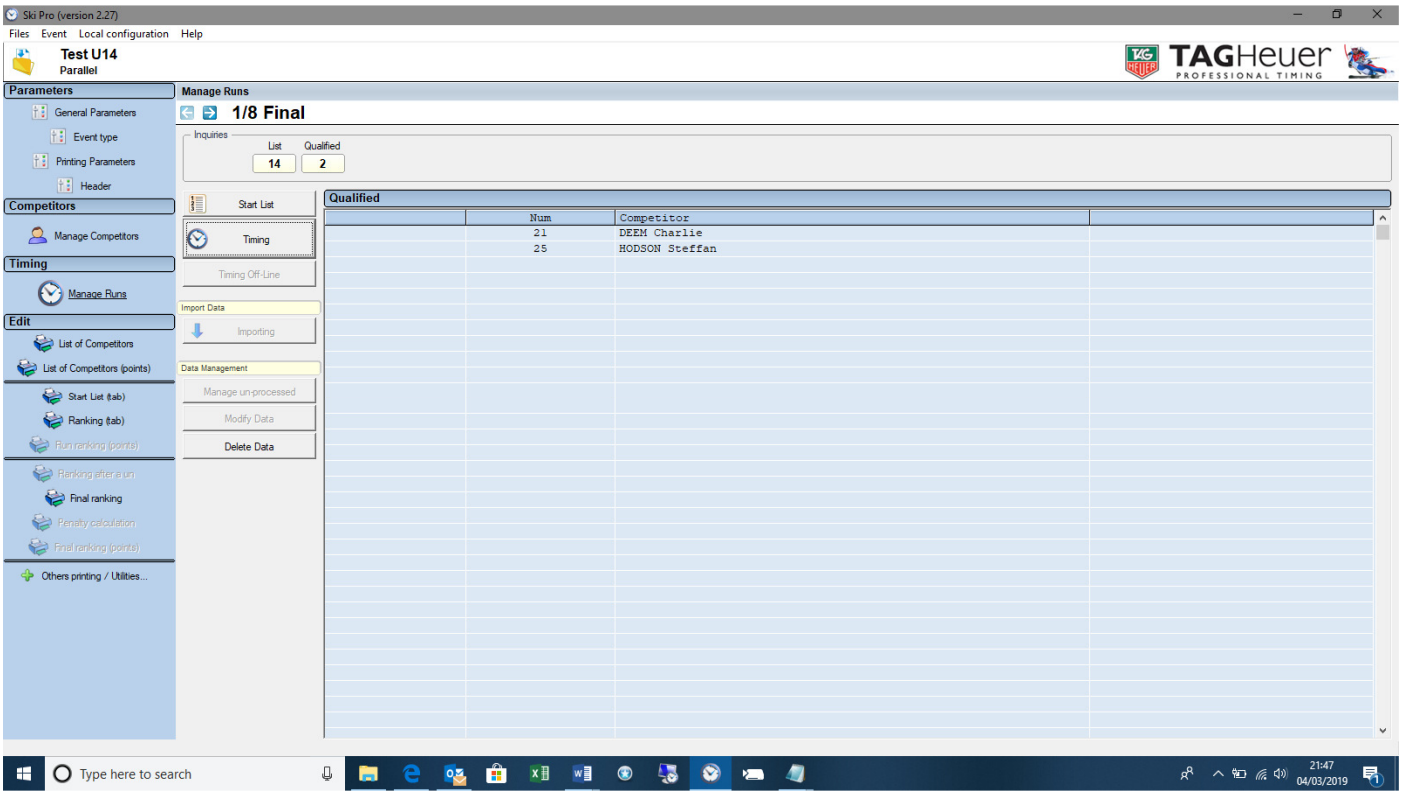

Click OK and your competitors are populated – in this example we only have 14 competitors so two have a bye to the next round, but you can let them ski the course so that they are not disadvantaged.

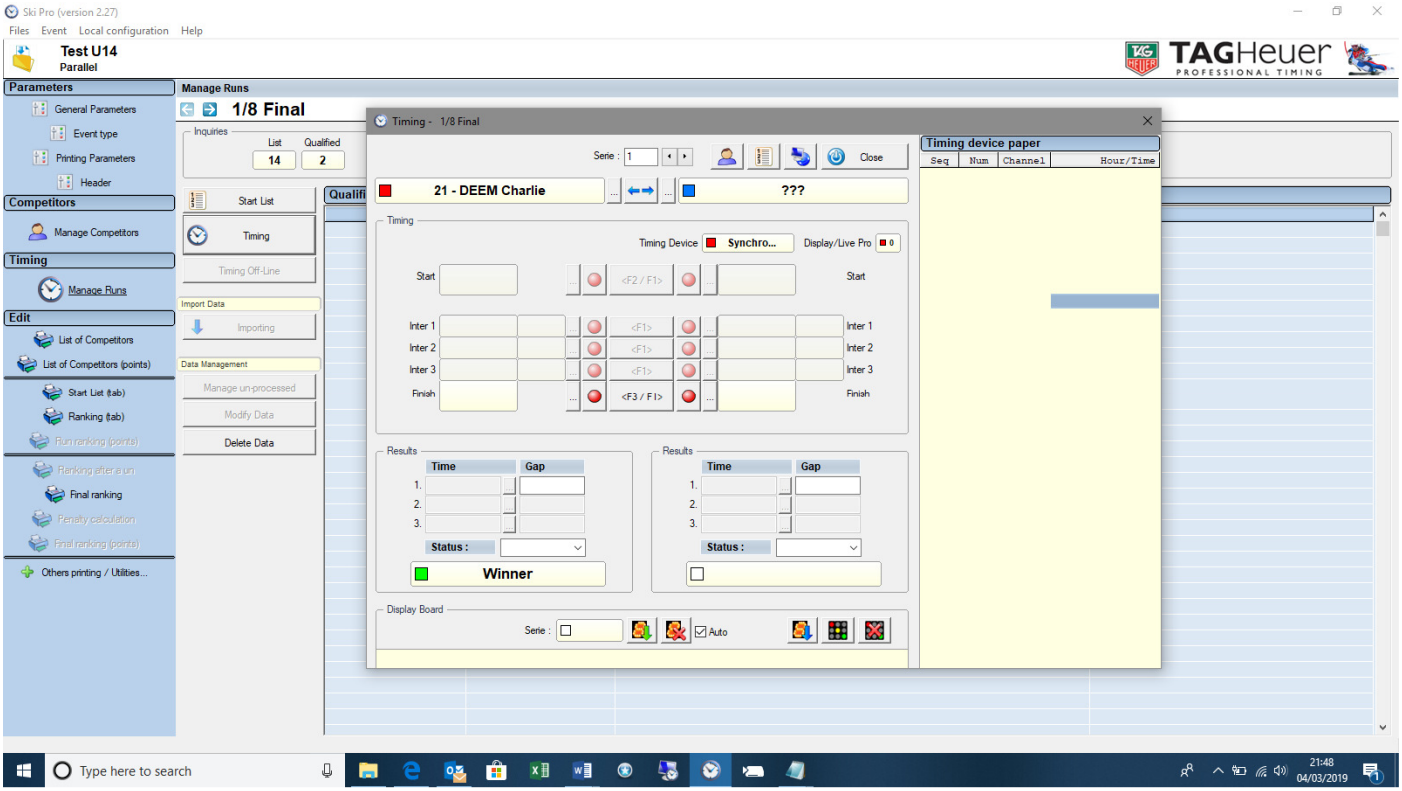

If you now click on the start list tab you can print your start list as normal:

You will see before you go in to timing the two competitors have already qualified for the next round.

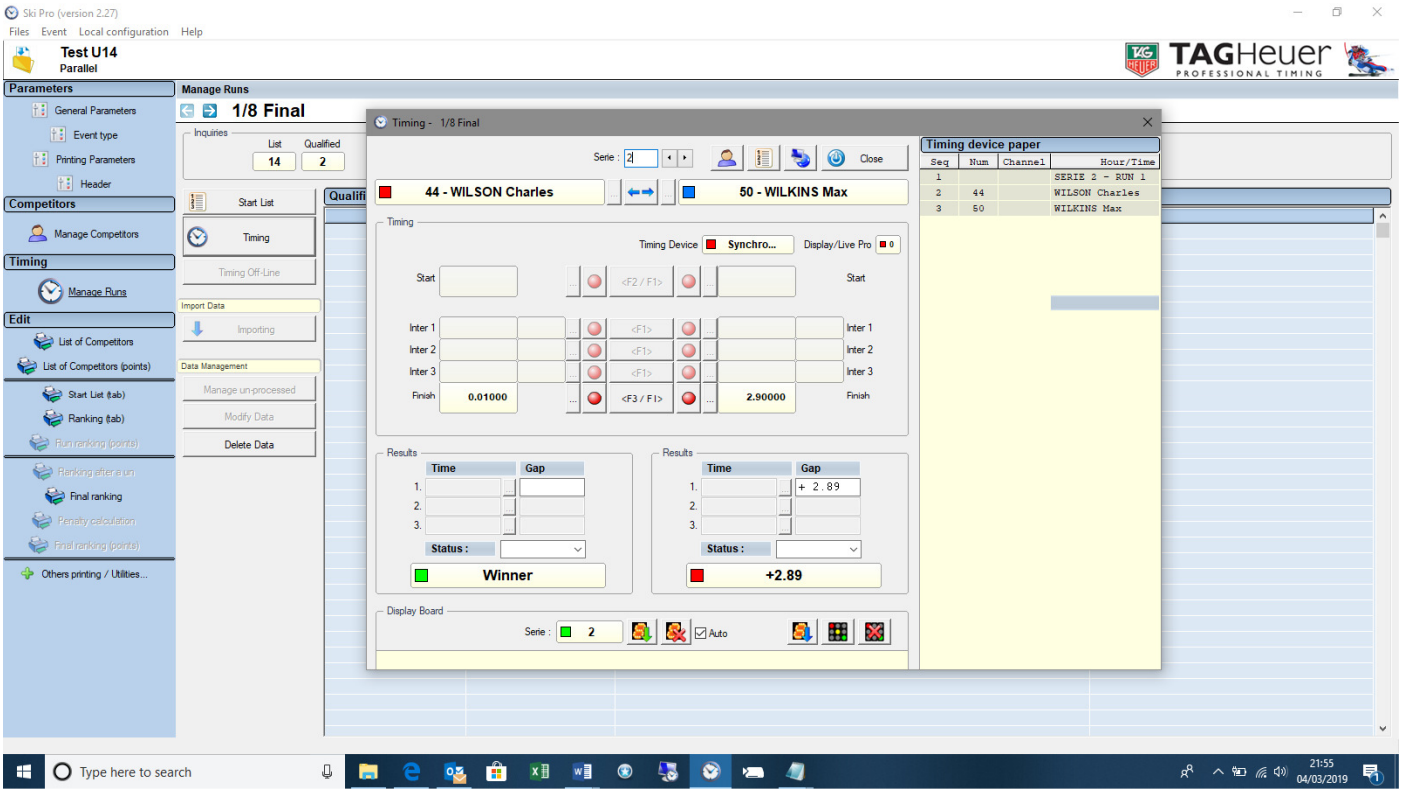

Now open timing and the screen below will appear – if you are running the event with live times feeding in from your timer make sure you have configured it in local configuration. You will need to unlock the finish pulses after each run. If you are keying the timing differences in manually click next to the finish lock button.

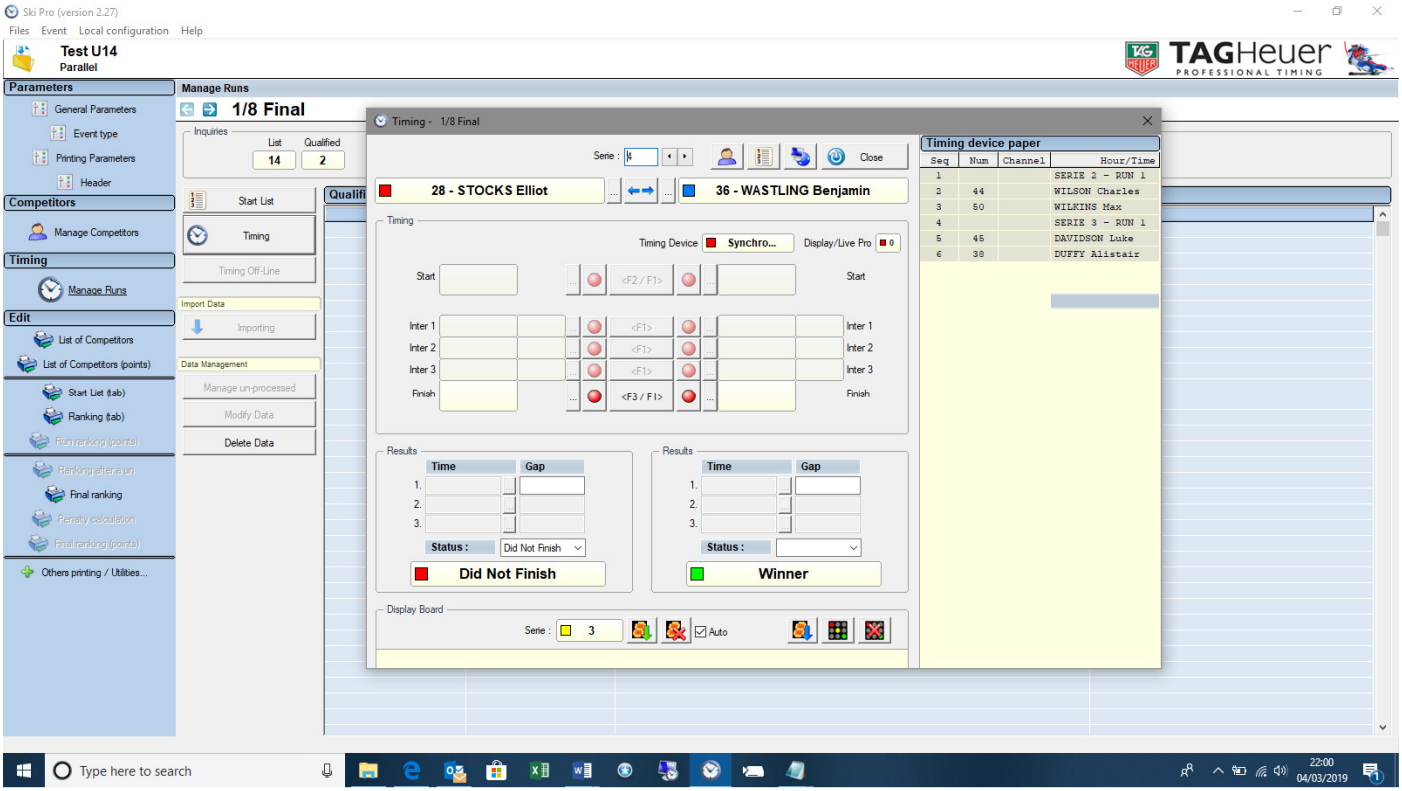

In the example above Charlie Deem has already qualified as there are only 14 in the event.

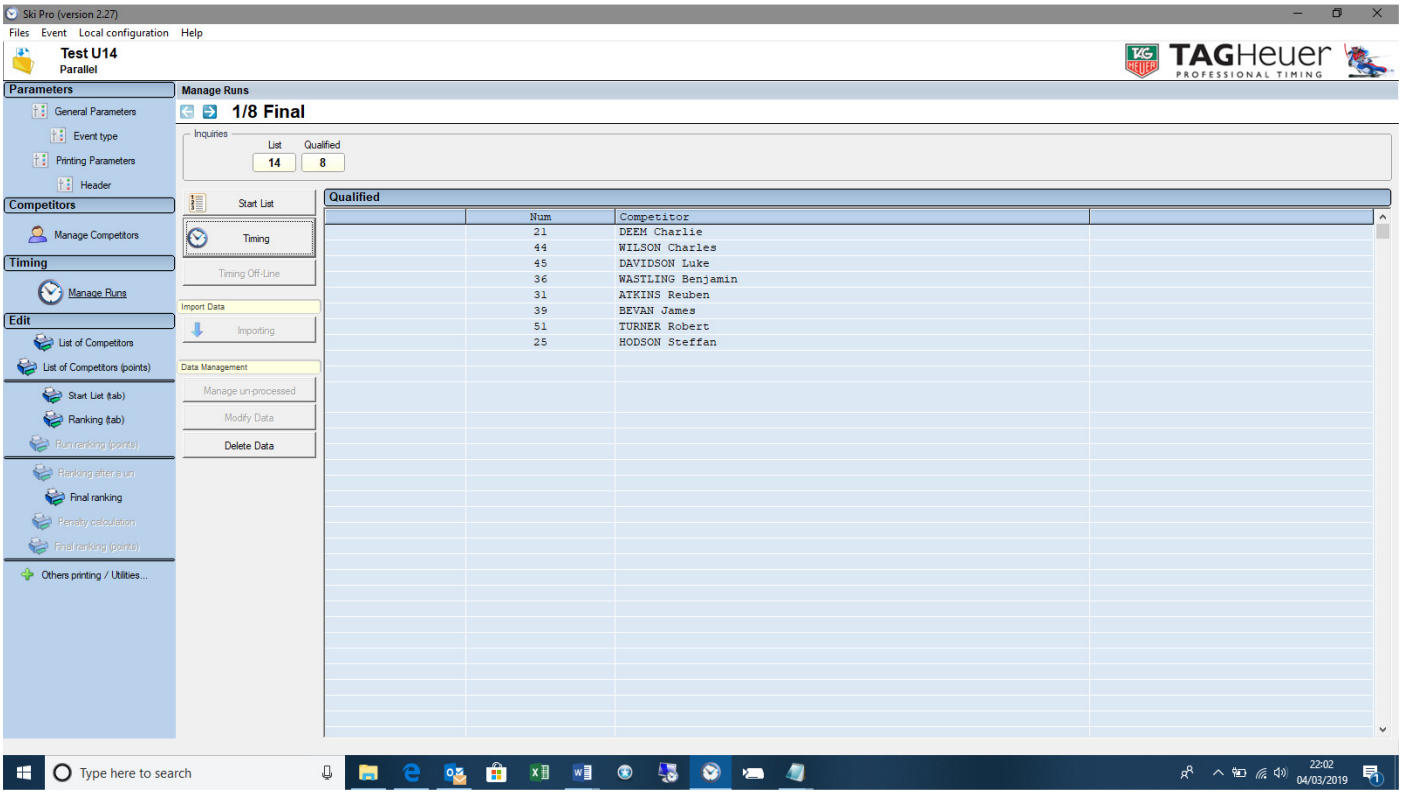

In the next heat we will key in the timing difference to create a winner

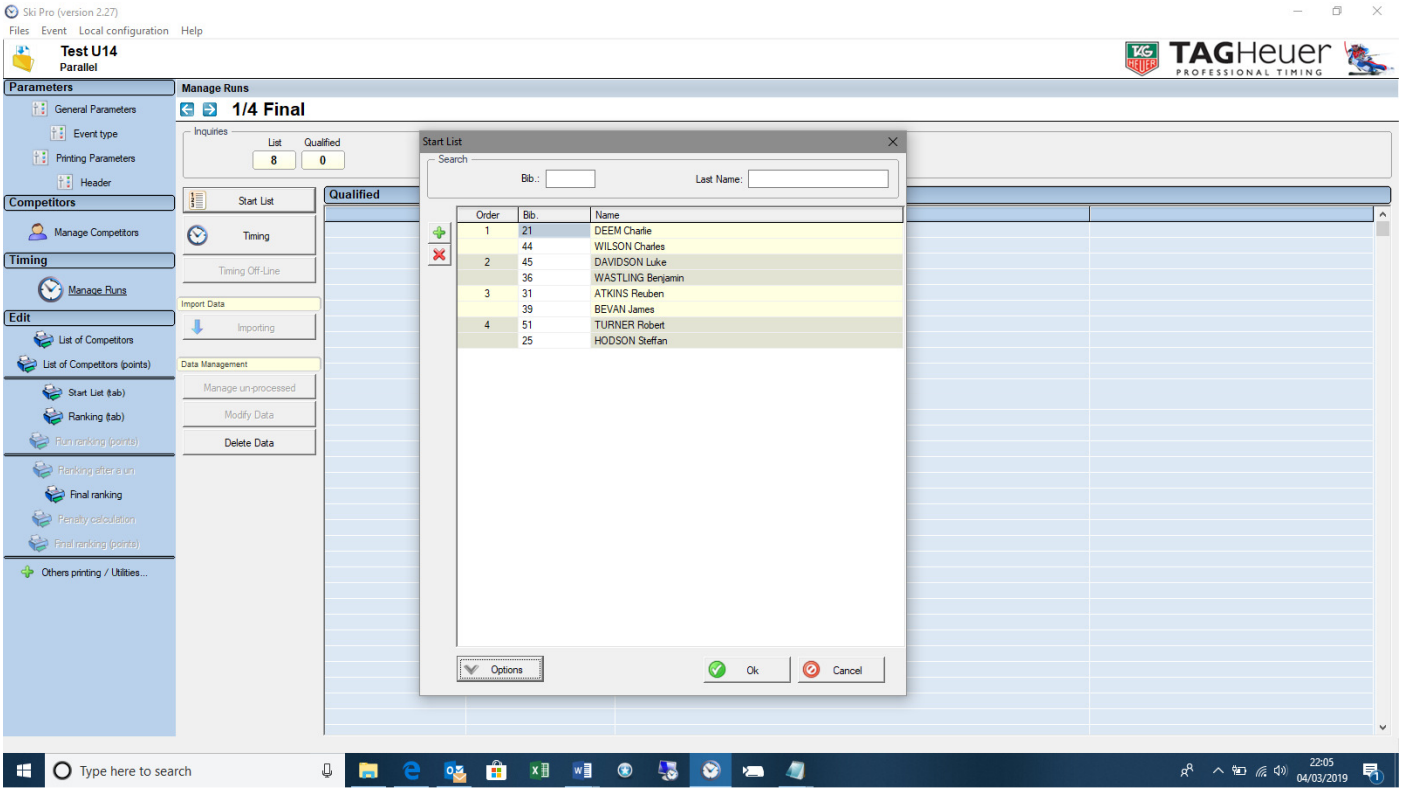

You need to key in a gap for the slower competitor – the status bars allow you to DNF / DSQ a competitor.

At the end of the heat and on exiting timing it shows who has qualified:

Proceed to the next round and create your start list again – prepare with last round.

Now run the heat as before through to the end of the event and you can print off your results as below.
